

LAB INCIDENT REPORT: M1 BREAK & DIAGNOSE

IT0043 Platform Technology & Version Control Audit

Student Name: [Your Name / Aki]

GitHub User: Aki1139

Repository: it0043-portfolio

Simulation Date: September 2026

1. EXECUTIVE OVERVIEW & OBJECTIVE

This document details the controlled execution of Scenario A (Remote URL Failure & Target Misconfiguration) within the Git workspace. The exercise demonstrates diagnostic isolation, error output analysis, and recovery procedures for non-existent remote targets.

2. ERROR REPRODUCTION & CONSOLE OUTPUT

The target origin was purposefully modified to a non-existent repository URL, followed by an upstream push attempt:

```
PS C:\it0043-portfolio> git remote set-url origin https://github.com/Aki1139/fake-repo-
does-not-exist.git PS C:\it0043-portfolio> git push --set-upstream origin main fatal:
repository 'https://github.com/Aki1139/fake-repo-does-not-exist.git/' not found
```

3. DIAGNOSTIC BREAKDOWN

SYMPTOM Remote Repository Not Found (404)

When executing `git push`, the client attempts to establish an HTTP handshake with the specified URL. The server responded with an HTTP 404 Status Code indicating no resource exists at the provided URI.

ROOT CAUSE Misconfigured Remote Target

The local Git configuration points to `fake-repo-does-not-exist.git`. Because Git cannot authenticate or match the path on GitHub servers, the synchronization operation halts before object transfer.

4. RESOLUTION & RECOVERY WORKFLOW

RECOVERY PROCEDURE

- Re-verified correct remote URL on GitHub: `https://github.com/Aki1139/it0043-portfolio.git`
- Updated local tracking using:

```
git remote set-url origin https://github.com/Aki1139/it0043-portfolio.git
```

- Pushed local commits and established tracking branch:

```
git push -u origin main
```

- Verified successful deployment on remote repository interface.
